350. CARDIOTRAST IN THE STUDY OF THE BRONCHIAL TREE (Russian text) - Voropayev, M. M. and Mazaev, P. N. - EKSPER. KHIR. 1958, 1(15-19) Illus. 2

The action of cardiotrast, in varying concentrations, on the bronchial tree, has been studied on animals under experimental conditions. In order to decrease the irritant action that the dye exerts on the bronchial mucosa and to impart to its solution sufficient viscosity that would help to fill the bronchial tree more slowly and evenly the authors experimented with various methods of anaesthesia and added glucose to the dye. In clinical practice the authors used 70% solution of cardiotrast, taking 20 ml. and adding to it 30 g. of glucose powder. Heated to body temperature cardiotrast mixes well with glucose, forming a viscous fluid. With thorough anaesthesia it is possible to fill the bronchial tree with the contrast dye, under fluoroscopy control, and to take X-ray films. An hour later no dye is found in the bronchi and cavities as revealed by the control X-ray film. Rapid elimination of the contrast dye from the tracheo-bronchial system enables, when necessary, to perform bilateral bronchography at short notice and to shorten the period between diagnosis and surgery.

AUTHOR: Voropayev, N. D.; Orayevskiy, A. N.

TITLE: Effect of saturation on generation of higher harmonics

SOURCE: Optika i spektroskopiya, v. 18, no. 6, 1965, 1086-1088

TOPIC TAGS: laser<sup>44</sup>, nonlinear effect, laser optics, harmonic analysis,  
harmonic generation

ABSTRACT: The authors consider the effect of saturation on the generation of higher harmonics in pulsed lasers, based on the model of a two-level system, assuming that the frequency of the external radiation is close to the interlevel transition frequency of the system. The equations of polarization for this model are given and solved for the field

$$\delta = \delta_0 \cos \omega_0 t + \delta_3 \cos (3\omega_0 t + \alpha).$$

This solution is used for qualitative evaluation of the polarization amplitude at the tripled frequency as a function of the amplitude of the external field. In view of the linearity of the Maxwell equations, the field amplitude for the third

Card 1/2

L 1072-66

ACCESSION NR. AP5016104

harmonic will have this same relationship to the amplitude of the external field.  
The transformation ratio from the first to the third harmonic  $\kappa = \frac{\epsilon_3}{\epsilon_1}$ .

which gives the efficiency of the crystal, will be proportional to  $\epsilon_1$ , in small fields, and independent of the external field in large fields due to saturation. The efficiency of frequency transformation becomes constant in large fields when there is an absolute increase in the intensity of the third harmonic with an increase in the amplitude of the stimulating radiation. AUTHOR: Voropayev, N.D.; Orayevskiy, A.N.

TITLE: Modes in a laser in the presence of an absorbing impurity

SOURCE: IVUZ. Radiofizika, v. 8, no. 2, 1965, 409-411

TOPIC TAGS: laser action, laser mode, laser, laser medium, stimulated emission, population inversion

ABSTRACT: The system of equations describing the fields in the cavity and the active medium of a laser, obtained by one of the authors earlier (Orayevskiy, Trudy fizicheskogo instituta im. P. N. Lebedeva v. 21, 3, 1963), is supplemented to take into account the presence of an absorbing impurity in the medium. Estimates show that the modified system of equations is nearly linear and can be solved by the small-parameter method. The condition under which lasing action can occur, namely that the power emitted by the active particles exceed the absorbed power, is derived. A numerical example is given. The results can be extended to the case when the line width and the reciprocal of the particle lifetime at the level are not equal. The principle can be used to develop shutter systems for tandem-connected lasers. Orig. art. has 10 formulas.

TITLE: Hydraulic damper. Class 47, No. 172578

SOURCE: Byulleten' izobreteni i tovarnykh znakov, no. 13, 1965, 95

TOPIC TAGS: hydraulic damper, worm gear drive, vibration damping

ABSTRACT: An Author Certificate has been issued for a hydraulic damper consisting of an internal conical surface and an external conical surface, with a gap between them being filled with a liquid (see Fig. 1 of the Enclosure). One of these surfaces is capable of radial motion for damping radial vibration. To prevent critical speeds in systems with several degrees of freedom through a change in the damping factor, the other part is adjustable in an axial direction, thus changing the liquid-filled gap. To move the part axially, the part is threaded to a worm-gear-driven ring incapable of axial motion. Orig. art. has: 1 figure. (LB)

TITLE: Radiation polymerization of ethylene in enlarged laboratory apparatus.

SOURCE: Plasticheskiye massy#, no. 2, 1964, 3-6

TOPIC TAGS: ethylene, radiation polymerization, reactor design, reactor surface area, reaction rate, polymer yield, reactor temperature field

ABSTRACT: Radiation polymerization of ethylene was conducted in laboratory reactors of 1-2 liter capacity (fig. 1 & 2). Based on tolerances admitted in this work, it was found that the temperature field can be calculated with sufficient accuracy. Comparison of reaction rates and yield of ethylene polymer shows that these factors are independent of the specific surface of the reaction space. Thus

Cord. 1/4

ACCESSION NR: AP4012181

commercial scale apparatus can be designed by estimating the process rate and yield dependence on pressure, temperature and dosage rate without concern for specific surface area of the reactor.

ABSTRACT : A summary is given of a paper devoted to the investigations of the Department of Microbiology I of the First Moscow "Order of Lenin" Medical Institute in the area of adaptation of organisms to sulfonamides and antibiotics. The authors concluded that the primary sensitivity of organisms to drug substances and their adaptive capacity depends on the degree of biochemical activity of the microorganisms. The better the cell resists the effect of the

; destructive agent or adapts to it, the more developed systems of enzymes it possesses. There was not noted any relation between the changes developing in the cell as a result of adaptation and the character of the drug substance. Only the intensity of these changes and the rate of their development were altered. Development of drug-resistant forms of organisms was considered a general biological phenomenon of adaptation of the organism to

TITLE: An Investigation of the Interaction of Crossed Polarized Metallic Filaments in Electrolyte Solutions for the Modeling of Coagulation Phenomena and Measurement of the Zero-charge Potential and the Constant of the van der Waals Forces

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 5, pp 981-984  
(USSR)

ABSTRACT: Direct experiments (Ref 1) and the theory of the durability of lyophobic colloids indicate that repulsive forces act between charged surfaces in electrolyte solutions which, at distances of the order of ion sheaths, may be stronger than molecular attractive forces. In order to bring two crossed filaments into direct electric contact, a certain energy threshold  $N_m$  is to be surpassed. This process may easily be seen from the abrupt drop of electric resistance between the two filaments as soon as contact has been established. Such measurements were made by the authors by means of platinum filaments  $300\mu$  thick (Fig 2). One filament was pivoted, loaded with a weight whose angle of rotation

Phenomena and Measurement of the Zero-charge Potential and the Constant of the  
van der Waals Forces

was recorded on a photoelectric relay by means of a mirror. With the help of a motor and mechanical gears the other filament was shifted slowly and continuously toward the first filament. The wires were placed in a hermetically sealed vessel which was filled with the electrolyte to be investigated. A circuit diagram in figure 3 demonstrates the manner in which the two wires are charged to a certain potential. The article further gives a detailed description of the cleaning of the wires and the vessel as well as of the polarization of the wires. As soon as the first wire had sufficiently approached, the second wire began to turn aside by rotation. A galvanometer indicated the passage of the energy threshold and the establishment of contact. The angle of rotation of the first wire at that instant was a measure of the amount of  $N_m$ . The latter was measured at various potentials in KCl solutions of a concentration of  $10^{-3} N$ ,  $10^{-2} N$ , and  $10^{-1} N$ . Results are given in figure 4. At the potential  $0.2 \pm 0.02 v$   $N_m$  passes through a minimum the ordinate of which is independent of

van der Waals Forces

the concentration. The constant of molecular attraction was computed with the help of a formula deduced by the second-mentioned author (Ref 3) for the action of hydrophobe, curved surfaces in electrolytic solutions:  $A = 6.6 \cdot 10^{-12}$  erg for an electrolyte concentration of  $10^{-3}$  mol/l, and  $A = 7.3 \cdot 10^{-12}$  erg for a concentration of  $10^{-2}$  mol/l. The theoretical dependence of  $N_m$  on the potential is illustrated in figure 4. The deviation of the experimental curves indicates the presence of neglected forces of a third kind. The value  $0.2 \pm 0.02$  v corresponds to the platinum zero charge. The method suggested is therefore suited also for measuring metal zero charges. In conclusion, mention is made of an article by A. N. Frumkin (Ref 6) on electrostatic repulsion of films. There are 4 figures and 8 references, 7 of which are Soviet.

**COVERAGE:** This is a collection of 25 articles in physical chemistry on problems of surface phenomena investigated at or in association with the Laboratory of Surface Phenomena of the Institute of Physical Chemistry of the Academy of Sciences USSR. The first article provides a detailed chronological account of the Laboratory's work from the day of its establishment in 1935 to the present time. The remaining articles discuss general surface force problems, polymer adhesion, surface forces in thin liquid layers, surface phenomena in dispersed systems, and surface forces in aerosols. Names of scientists who have been or are now associated with the Laboratory of Surface Phenomena are listed with references to their past and present associations. Each article is accompanied by references.

TITLE: Determination of the points of zero charge by the method of crossed polarized metallic threads

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniya khimicheskikh nauk, no. 2, 1963, 257 - 263

TEXT: A new direct method is described for determining the points of zero charge in metals by measuring the force barrier preventing the contact of two polarized metal threads in an electrolyte. Two threads of Pt, Au, or Fe, 200 - 300  $\mu$  in diameter, were mounted orthogonally in a vessel in such a way that they could be brought into contact with the aid of a d-c motor. The vessel was partly filled with an electrolyte (KCl,  $MgSO_4$ ,  $H_2SO_4$ ). The metal threads could be polarized separately to any given potential by ~~two~~ Pt electrodes. The potential was measured using calomel with KCl solutions, and Hg-Hg<sub>2</sub>SO<sub>4</sub> with  $MgSO_4$  and  $H_2SO_4$  solutions as reference electrodes. The potential difference of 0.01 v between the two threads was nullified at the moment of contact and the two threads were separated again automatically.  
Card 1/2

Determination of the points...

S/052/53/000/002/007/920  
B144/B186

The angle of rotation was measured with a photorelay. The value of the force barrier was recorded on an electronic potentiometer at the moment-of contact. The points of zero charge correspond to the minimum or zero values of this force barrier, as is shown by measurements at different potentials. The force barrier determined for Pt threads in KCl solution showed a distinct minimum at  $0.20 \pm 0.01$  v in 0.001 M KCl, which became flatter in 0.01 M KCl and disappeared completely in 0.1 N KCl. The electrolytes used with gold threads were  $10^{-3}$  M KCl and  $3 \cdot 10^{-4}$  N  $\text{La}(\text{NO}_3)_3$ . In both cases the minimum was observed at 0.05 v. For Fe threads, the minimum of the force barrier in  $10^{-2}$  N NaOH (Fe is passive) was at 0.34 v, in  $3 \cdot 10^{-3}$  M and  $10^{-2}$  N HCl (Fe is active) at -0.4 v. There are 9 figures and 1 table.

TITLE: The First Finds of Fauna in the Verkholenskaya Series  
(Pervyye nakhodki fauny v Verkholenskoy svite)

PERIODICAL: Doklady AN SSSR, 1957, Vol. 114, Nr 6, pp. 1291-1293  
(USSR)

ABSTRACT: The multicolored series of the layers conditionally designated as Upper Cambrian, which is widely spread in the South of the Sibirskaia platforma (Siberian platform), until 1954 was considered as faunally not characterized, as no organic remains were found in the mighty masses of red rocks. Outside the amphitheater of Irkutsk a scarce fauna with Lingula, Obolus, hooded gastropods and algae was found (reference 3). Then Vologdin and Korde (reference 1) found small-columned stromatolites with well marked microstructure in great variety among the Ordovicain layers with Angarella on the Angara-river in the uppermost part of the Upper Cambrian. Beside cyanophydeae moss-animals (Bryozoa) were found as well as the oldest representatives of the cephalopods from the group of mixochoanites. In 1953 finally M. A.

## The First Finds of Fauna in the Verkholensk Series

20-114-6-42/54

Tsakhnovskiy found a new genus of trilobites (related to the Upper Cambrian Crepicephalus Owen) on the river Podkamennaya Tunguska. The author characterizes the cross section of the multicolored mass and the masses in contact with it in the interfluvial region Leno-Angaro-Okinskoye. The following deposits occur there: Ordovician, Ust'kutskaya-suite ( $O_1$ ). Light sand- and lime-stones with algae, gastropods and brachiopods, on the Lena river lead-bearing, 200-300 m thick. Upper Cambrian. Veroholenskaya-suite ( $Cm_3$ ). It consists of the following subsuites and horizons: Upper sandmarl-lime-subsuite ( $Cm_3^1$ ). Kardinskiy horizon, 30-180 m thick. Central subsuite, predominantly consisting of sandstone ( $Cm_3^2$ ). Ryutinskiy horizon ( $Cm_3^2a$ ), 90-130 m thick. Mikhaylovskiy horizon ( $Cm_3^2b$ ), 70-180 m thick. Ust'al'kinskiy horizon, 30-70 m thick. Lower gypsum-marl-subsuite ( $Cm_1^1$ ), 100-200 m thick. Middle Cambrian ( $Cm_2$ ). Variegated horizon ( $Cm_2^{1-2}$ ), 0-50 m thick. The fauna of the Verkholenskaya-series contains relatively manifold groups. Weathered impressions of Arthropoda were found between Kachug and the harbor of Osetrovo in the Ust'-al'kinskiy (?) horizon. According to N. I. Novozhilov they belong to those similar to Merostom, namely to the

forms which are similar to the genus Yohoia Walcott (family Yohoiidæ Henriksen, order Opabinida Stromer) (reference 6). The animals were spindle-shaped, of various size (figure 1). In the same year, 1955, well preserved remains of the same type were found in the Mikhaylovskiy horizon on the Angara river (figure 1). A rest from the Ryutinskiy-horizon probably also belongs here (figure 2). Trilobites were found in the Kardinskiy-horizon, 40 m below the contact with the Ordovician. Furthermore mud-eaters from several horizons, and algae are known in the Verkholenskaya-series. From the same series 13 types of spores are known. Thus quite a substantial fauna and flora existed here. As they were not yet sufficiently studied, it is not possible to make a division of the variegated series according to them. It may only be assumed that the lower parts of the Verkholenskaya series will prove to be Upper instead of Middle Cambrian.
